

# Variations of the front end for a neutrino factory

David Neuffer

*FNAL*

(September 15, 2009)

- **Front End for the Neutrino Factory/MC**
  - Shorter front end example-
    - basis for present study
- **Rf cavities in solenoids?**
  - high gradient cavities may not work in  $\sim 2\text{T}$  fields
  - Option explored
    - Use lower fields ( $B, V'$ )
- **Need baseline design for IDS**
  - need baseline for "5-year Plan"

- Reduce drift, buncher, rotator to get shorter bunch train:
  - 217m  $\Rightarrow$  125m
  - 57m drift, 31m buncher, 36m rotator
  - Rf voltages up to 15MV/m ( $\times 2/3$ )
- Obtains  $\sim 0.26 \mu/p_{24}$  in ref. acceptance
  - Similar or better than Study 2B baseline
- Better for Muon Collider
  - 80+ m bunchtrain reduced to  $< 50m$
  - $\Delta n$ : 18  $\rightarrow$  10

500 MeV/c

-30

40m

➤ **Buncher and Rotator have rf within ~2T fields**

- rf cavity/drift spacing same throughout (0.5m, 0.25)
- rf gradient goes from 0 to 15 MV/m in buncher cavities

➤ **Cooling baseline**

- ASOL lattice
- 1 cm LiH slabs (3.6MeV/cell)
- ~15MV/m cavities
- also consider H<sub>2</sub> cooling

**ASOL lattice**

- Major uncertainty is high-gradient rf within solenoidal fields
  - $V'_{rf} / B_{solenoid} ???$
  - Currently have  $B = 1.5$  to  $2T$ ,  $V' = 12$  to  $15$  MV/m
  - baseline frequency is  $\sim 200$  MHz
  
- Experiments have achieved  $\sim 14$  MV/m at 2.5-T
  - ( $\sim 0.75$ -T at nearest thin Be window)
  - Solenoid near 201 MHz cavity

- Change magnetic field,  $V'_{rf}$  to study limits
- Use “short” front end for studies
  - Baseline had 2T solenoid in drift and buncher
    - 0 to 15MV/m rf
  - 15 MV/m in rotator; 15 MV/m in cooler
    - vary rotator from 9 to 15 MV/m;
    - Cooler 10 to 18 MV/m
      - all in 0.5m rf, 0.25 drift cells
      - with lower gradient

➤ Muons per 10 8-GeV protons

Cooler/ Rotator	10	12	14	15	17	18 MV/m
<b>10</b>	0.35 (0.63)	0.55 (0.67)	0.66	0.73		
<b>12</b>		0.57 (0.72)	0.754	0.77		0.80
<b>14</b>			0.776	0.80	0.84	
<b>15</b>				0.81	0.85	0.84
	(0.65cm)	(0.8cm)				

Variation is not strong; more rf still means more muons

## Next try changing B

- **B= 1.25 T (~Study 2)**
  
- **match into alternating solenoid**
  - Use old R. Palmer match
  
- **As before, lower cooling gradient implies using less absorber per cell**
  - 15MV/m - 1cm LiH
  - 12MV/m - 0.8cmLiH (~5% worse than 15MV/m)
  - 10MV/m - 0.65cm (~10% worse than ~15MV/m)

## ➤ Muons per 10 8-GeV protons

Cooler/ Rotator	10	12	14	15	16	17 MV/m
<b>9</b>	(0.58)			0.68		
<b>10</b>	(0.61)	(0.65)	0.655	0.705		
<b>12</b>		(0.67)		0.75		
<b>14</b>			0.72	0.77		
<b>15</b>				0.78	0.805	0.81
	(0.65cm) z=231m	(0.8cm) z=220m		1.0cm z=204m		

Variation is not strong; more rf still means more muons

**$B=2.0T \rightarrow 1.25T$**

- **$B=2T$  is only slightly better than  $B=1.25T$** 
  - only ~5% fewer  $\mu/p$  in acceptance at 1.25T
  
- **Optimum  $B$  is (probably) somewhere in between**
  - $B=1.75T$  for study 2A
  - Cost optimum is (probably) less

- Adequate acceptance can be obtained by reducing magnetic fields and gradients
- $B \rightarrow 1.25\text{T}$ ,  $V' \rightarrow 10\text{ MV/m}$  ??
  - (10MV/m is 7MV/m real estate gradient; could use 7MV/m if space is filled.)
- Reduced  $B$ ,  $V'$  are relatively certain to work.
- Cost optimum?
  - $B=1.5\text{T}$  ?,  $12\text{MV/m}$

# Change cavity material-Palmer

➤ Tech-X rf breakdown modeling workshop

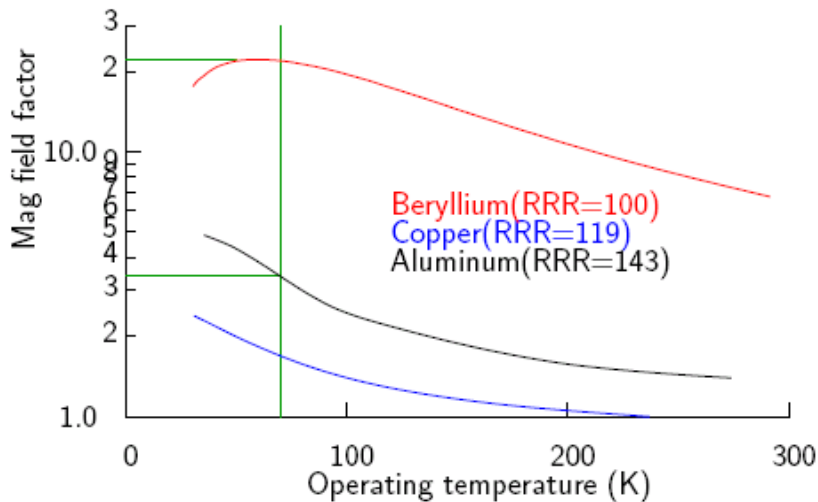

Bob is convinced Be would solve the Front End Problem ?

Breakdown gradient  $\mathcal{E}$  vs  $B$  for Cu, Be, Al  
For other materials damage assumed at the same strain as Cu at 50 deg.

Needs experimental tests !!!

Relative B for same strain

- Cold beryllium gives reduction  $B_{damage} > 10$  should solve the problem for all cases

- Need one design likely to work for  $V_{rf}/B$ -field
  - rf studies are likely to be inconclusive
  - $B=1.25T$ ;  $V' = 10MV/m$  is very likely to work
  - $B= 2T$ ;  $V' = 15 MV/m$  should work with Be
- Hold review to endorse a potential design for IDS
  - - likely to be acceptable ( $V_{rf}/B$ -field)
  - April 2010 ?
- Use reviewed design as basis for IDS engineering study

- For IDS, we need an rf cavity + lattice that can work
- Potential strategies:
  - Use lower fields ( $V'$ ,  $B$ )
    - 10MV/m at 1.5T?
  - Use non- $B = \text{constant}$  lattices
    - alternating solenoid
- Magnetically insulated cavities
  - Is it really better ???
  - Alternating solenoid is similar to magnetically insulated lattice
- Shielded rf lattices
  - low  $B$ -field throughout rf
- Use gas-filled rf cavities
  - same gradient with/without fields
  - but electron effects?
