

G4MICE vs ICOOL

Chris Rogers,
ASTeC,
Rutherford Appleton Laboratory

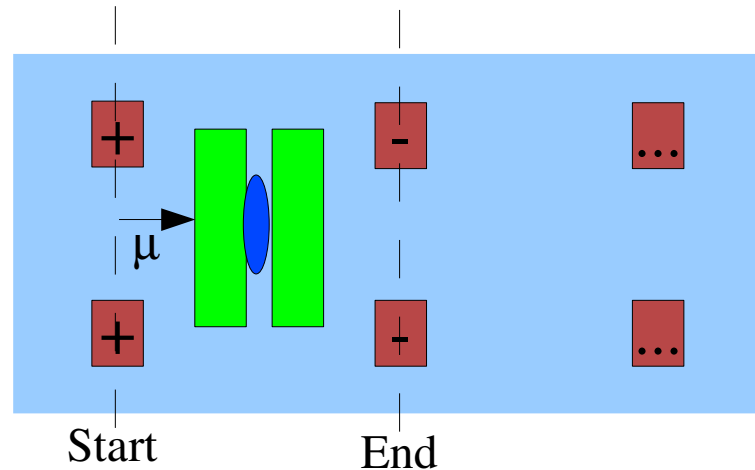

G4MICE and ICOOL

- G4MICE
 - Written for MICE experiment
 - Based on G4 physics model
 - Tracking
 - Physics processes
 - Adds field maps for multipoles, solenoids, rf cavities
 - Plus some beam optics, mapping, analysis routines
 - Last time I did a detailed study of the tracking was ~ 3 years ago
 - Tracking by integration of Lorentz force with 4th order RK
- ICOOL
 - Written for simulation of cooling for Nu Factory and Mu Collider
 - Internal physics and tracking routines
 - Many different field models
 - “Well known” by community

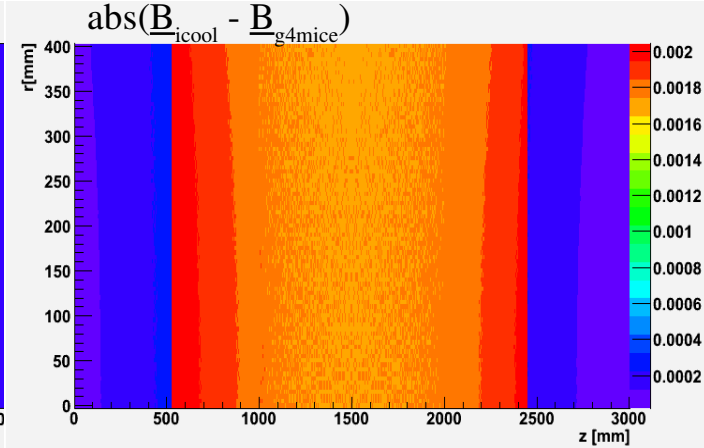

Cell Model

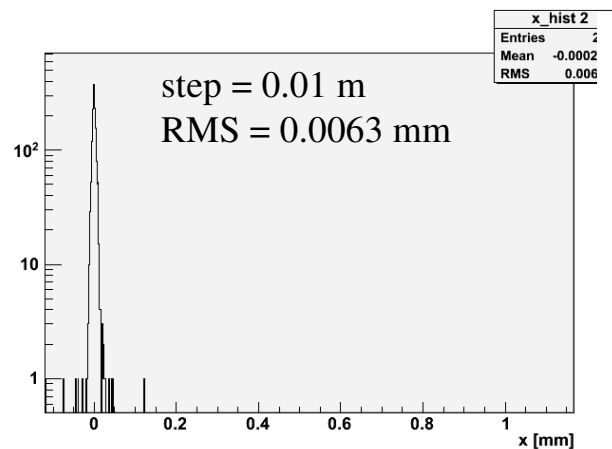

- 3 m cell
 - Start with just magnets
 - Then add pillbox cavities
 - First look at rf field maps also
 - Not in most of my simulations, but will want it sometime
 - Ambition to add Parmila solenoid field maps
 - Then add IH2
 - Don't look at windows yet
 - But will want this also soon
 - Presume if we have IH2 that's “good enough”

- ICool, magnetic field only
 - $x(\text{step}) - x(1\text{e-}5)$ [mm], where step is step size in tracking
 - BiLinear interpolation from a field map
 - Grid spacing 5 mm in r and 1 mm in z
 - Disable dynamic step size allocation

- Use ICOOL field map in G4MICE
 - Compare tracking in ICOOL step=1e-5 m with G4MICE step=1e-4 m
 - Compare G4MICE field map with ICOOL

- Use G4MICE field map, all BiLinear interpolation
 - Tracking in ICOOL with ICOOL field map, step size 1e-5 m
 - Compare with tracking in G4MICE with G4MICE field map

x_dz=0.125.dr=0.005

x_dz=0.25.dr=0.005

x_dz=0.5.dr=0.005

x_dz=0.001.dr=0.02

x_dz=0.001.dr=0.04

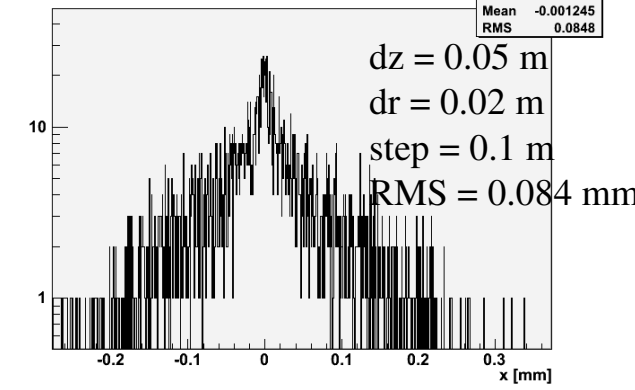

x_dz=0.001.dr=0.08

- Choose grid size for magnetic field map
 - Quite a hard cut-off as z grid size changes
 - Gradual cut-off for radial grid size
- Choose $dz = 0.05$ m, $dr = 0.02$ m, $step=0.1$ m
 - Enable dynamic step size allocation
 - Nominal error 1 mm

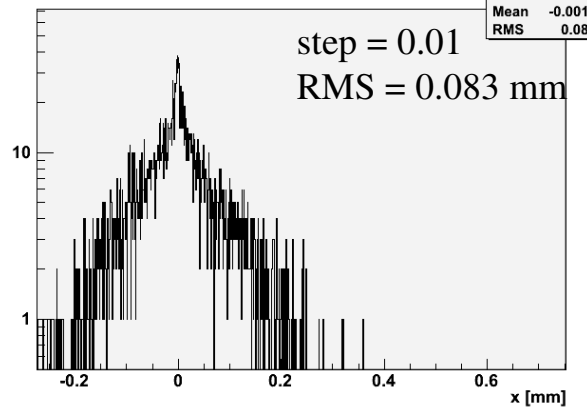

x_dz=0.05.dr=0.02.step=0.1.d1s=1mm

x_step=0.1.rf_30_degrees

x_step=0.01.rf_30_degrees

x_step=0.001.rf_30_degrees

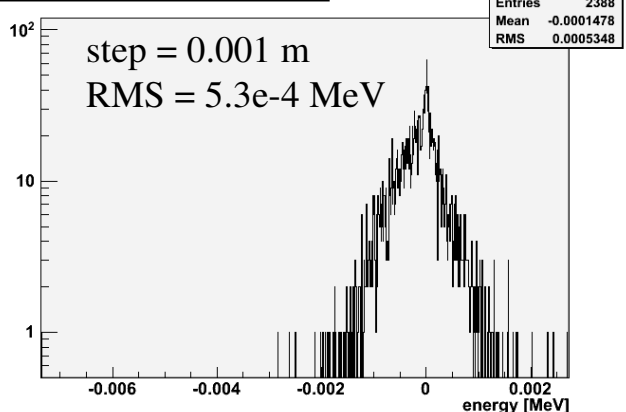

energy_step=0.1.rf_30_degrees

energy_step=0.01.rf_30_degrees

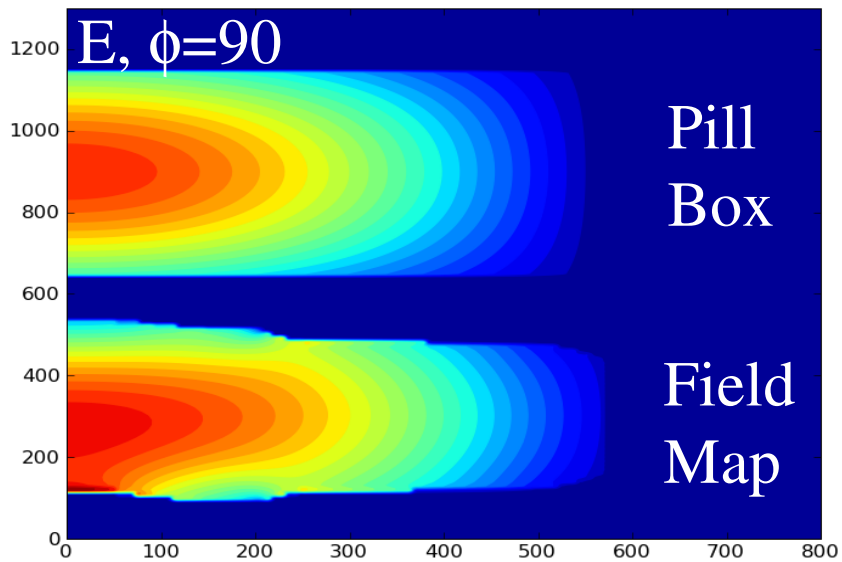

energy_step=0.001.rf_30_degrees

- Introduce RF cavity

- Analytical model for pill box
- Compare ICOOL step size 1e-4 with G4MICE
- x limited by magnetic field map size
- 0.1 m step size still ok

Absolute value of field seen by particle travelling at c
Peak E-Field = 17.5 MV/m, peak B-field ~ 20 mT

x_rf_map_vs_pb

energy_rf_map_vs_pb

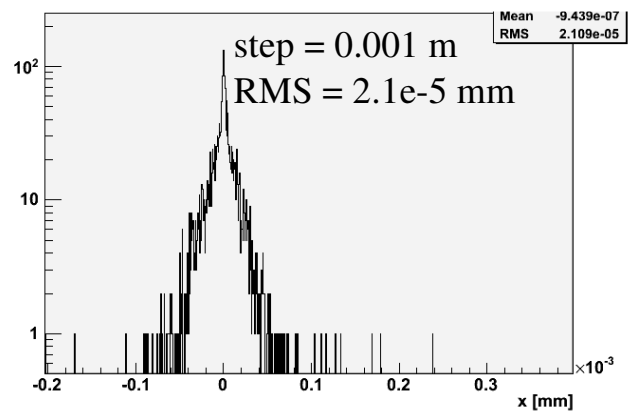

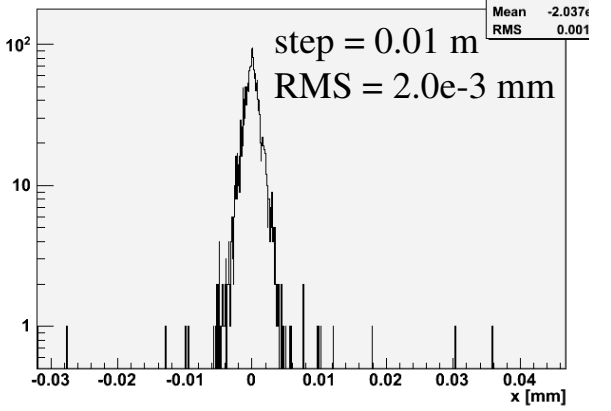

Introduce RF field map from superfish

- Compare with pillbox
- Look for self-consistency

energy_rf_map0.1

x_rf_map0.01

energy_rf_map0.1

energy_rf_map0.01

energy_rf_map0.001

- Now add liquid Hydrogen
 - Stochastics switched off!
 - Look at difference between G4MICE tracking and ICOOL

- Switch on stochastics
 - Track through 20 cm of IH2 in field map
 - Look at distributions before and after IH2
 - 1e5 muons with initial $p=230$ MeV/c, no transverse

A decorative graphic in the top-left corner consisting of overlapping colored squares (green, red, blue) and a black crosshair.

Conclusions

- Simulation codes compare well
- For identical field models, tracking in G4MICE is convergent on tracking in ICOOL
- Started checking Superfish field map routines
- Physics processes in IH2 look similar
